

# Using the Delphi method

We consulted 334 people identified as experts in the fields of survey methodology, children and youth, well-being, and policy. Our aim was to gather opinion on survey design, feasibility, and key policy challenges concerning children and young people's well-being

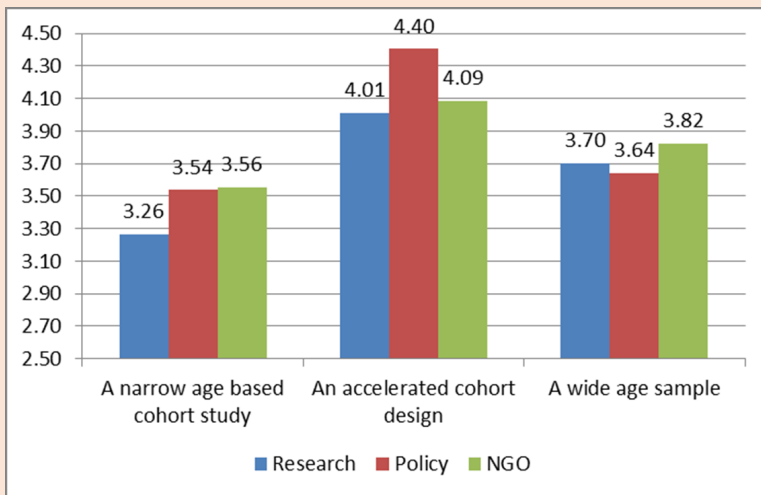

Who did we consult?

Questionnaires were completed in 3 waves: October, December, February  
Response rates: 75%, 58.9%, 61.7%

“From my experience, the data collected through a longitudinal survey can play a key role in addressing existing gaps in data coverage and therefore can be valuable resource at the policy and decision making level.” (Policy expert, Delphi 2)

Our survey asked what would be the most desirable design for a longitudinal cross-European survey

The economic benefits of improved well-being far exceed the cost of a longitudinal survey (93.8% agree, of whom 50.6% strongly agree)

A longitudinal survey will support policy makers to improve policy design and impact and make policies more efficient (97.9% agree, of whom 58.6% strongly agree)

Evidence gathered by such a survey will contribute to improved well-being (95.6% agree, of whom 45.3% strongly agree)

Is a cross-European longitudinal survey technically feasible?
